BMI categorization is based on the WHO guidelines10: Normal: 18.50 - 24.99 kg/m 2 , and obese ≥30.00 kg/m 2 . Results are shown as percentage of the group (n=100 for normal group and n=100 for obese group). P-value calculated using Chi2 test.

The daily intake of snacks, dairy products, nuts , and grilled food in normal group was lower than obese group (P-value > 0.05). There was no difference in the daily consumption of vegetable, whole grains and boiled food among the two groups. The daily intake of red/white meat was the same in both groups. The consumption of sweets and fast food , in twice per week , was lower among normal group with no differences between the two groups in sweets (P-value = 0.96) and fast food (P-value = 0.94). The consumption of fried food , in twice per week , was higher among normal weight group. There were no differences between the two groups in fried food (P-value = 0.90). The consumption of sugar beverage , in twice per week , was equal in both groups with no difference in sugar beverage intake (P-value = 0.35).

The daily consumption of the two food group categories “dates” and “fruits (except dates)” was lower in normal weight group than obese weight group (P-value = 0.01 and 0.02 respectively). The intake of dressing in twice per week was lower among normal weight group. There was a difference in dressing intake between normal and obese weight group (P-value = 0.03). Figure 1 and 2 .

Energy and macronutrients intake

Table 3 shows the difference in calories and macronutrients intake between normal and obese weight groups.

Figure 3:
Physical Activity Levels in normal and obese groups

Physical Activity level
In general,
we registered

a
significant
difference between normal and obese group
s
in PA level. (P-value = 0.016) (
Figure 3
)
.
Normal group was lower than obese group in
term
of being A
ctiv
e
(25% versus 42%), (P-value = 0.03).
Normal group was higher than obese group in moderate activ
e
level (33% versus 19%)
.
However,
no difference between them
upon
this level (P-value = 0.052)
was observed
. In addition, normal group was higher than obese group in moderate
inactive
level (33% - 25%)
. However,
normal group was lower than obese group in inactive level (9% and 14% respectively)
nevertheless
there
was
no difference between them in these two levels (P-value = 0.29).

Discussions

Due to the high prevalence of obesity in Saudi Arabia among females reaching up to 33.5% [
6
], the aim of the present study was to assess the WMP among obese and
normal weight among University students at PNU. Such a study
attempted
to develop an insight analysis of how does this population deal with weight control and lose
and to which extent the adopted practices were safe and healthy. Findings revealed that
the majority
(92%)
of obese students
was
unhappy with their current weight.
Furthermore, p
revious studies show
ed
that obese people might compare their own body shape to the body images of models that reflects a negative
attitude
and
dis
satisfaction about their weight
[
1
4
]. According to
Sides-Moore and
Tochkov
(2011)
, unhappiness with body images might lead to eating disorders, low self-esteem, and depression [
14
].
This might be reflected in developing inappropriate behavior such as attempting different methods to lose or reduce their
body
weight. Indeed, high proportion (93%) of obese participants
,
in the present research
,
stated
an attempt to reduce their body
weight. However, most of reported practices used to achieve such a goal was unhealthy, aggressive to health and ineffective.
For that purpose
, frequent practices
were used for
reducing calorie intake (63%), skipping meals (59%) or fasting for long periods of time (37%). Karelis et al. (2008) reported
, in healthy obese people,
that attempts to achieve weight loss

,
through
diet restriction
,
might
be actually counterproductive and potentially harmful [
15
].
The
same authors
noticed
that a 6 months' hypo-caloric diet significantly induced insulin sensitivity deterioration in healthy
obese persons [
15
].
The unbalanced dietary intake and bad food habits
,
among obese
group
, constitute another main finding of the current study
, since
we found
significant fat intake
compared to normal group.
This amount
represented
36% of total energy intake, while it should be ranging
between 20-30% according to the RDA [
16
].
This
result
agrees
with
a
previous study
in
which
authors observed
that high
consumption
of fat and carbohydrate may contribute to obesity in men [
17
].
On the other hand, daily consumption of fruit, date
,
and dressing was significantly higher in obese compared to normal group
too
(22%, 31%, 22% versus 10%, 25%, 7% respectively). It is well known that dates contain a high percentage of carbohydrate (sugar)
and calories
compared
to
most fresh fruits
[18
]. Salad dressing are usually made with processed oil which is rich in fat, sugar
,
and calories. Studies in Saudi Arabia reported
that
the increased intake of snacks consumption is often accused for increased prevalence of obesity. As
reported
by Al-
Rethaiaa
et al. [
5
], eating snacks was a
common
habit among students and its daily consumption was reported in 31.7% of them. In our study, the daily consumption of snacks
,
in normal weight group
,
was lower than obese weight group (39% and 42% respectively), although not significant.
Assessment of the level of PA indicated a high level of physical inactivity among both groups
;
42% and 39% among normal group and obese group, respectively.
Abdulmohsen
et
al. (2015) reported similar
results
from a
national survey among women in Saudi Arabia. The
same authors
found that physically inactive women showed the highest proportion compared to moderate and high

active women [
19
]. In a recent study
,
carried out by
Al-Bakr
et
al. (2016)
,
no significant association
has been
found between obesity and the level of
PA
among Saudi
women [
20
].
Therefore
, in the present study,
the number
of active participants in obese group was significantly higher compared to normal group. A possible explanation would be
that
some participants of the obese group were engaging in gym and might have physical activities plan. However, such details were not
investigated in the
current
study
and constitute then one of the study limitations
.
Other limitations
of
our
study
should be mentioned.
Although its speed and ease of administration, t
he
24-hour recall
method
has
some
limitations and might not represent the long-term dietary habits of investigated participants.
W
e
confronted
some
difficult
ies
in
collecting
data
due to
memorization
, perception, conceptualization of food portion sizes, and presence of observer, which might explain the low total calorie intake
reported in both groups.

Conclusion
Taken together,
the
results of th
e
present study suggest that obese group of students in PNU undertake unsafe and unhealthy practices to lose or control their
body
weight
.
T
he dietary intake is inadequate
and
rich in sugars and fats.
I
ncreas
ing
awareness and encourag
ing
students, mainly
the
obese
ones
, to change their lifestyle by adopting healthy alternatives to manage their
body
weight

, is highly recommended
. A healthy lifestyle relays on balanced diet characterized by consumption of fruits, vegetables,
dietary
fibers
,
and limiting saturated fat and simple sugars,
with
maintaining a regular PA. Thus, a special emphasis on the need for safe and healthy
eating
strategies and coordinated efforts at all levels (family,
university, community
,
and government) to counter together the obesity among young adult female and ensure optimum health and well-being to them.
