</w:r>

Aims
:
To examine the association of dietary patterns, socioeconomic status
,
and the body mass index in Moroccan adults
.
Methods
and
Material

```

:

This is an analytical case-control study, conducted among obese (n=100) and non-obese (n=150) subjects, aged between 18 and 59 years old,

when

women represented 60% of participants. At recruitment, all anthropometric parameters were measured.

T

he body composition was assessed by the use of impedance meter.

D

ietary habits w

ere

assessed

using

24 hours' food recall and food frequency questionnaire. The results were analyzed using the Kolmogorov-Smirnov (K-S) and the chi-squared (

χ^2

-test)

test and the percent distribution

.

Results

:

Our results showed that abdominal obesity and overall body fat (BF) percent were much prevalent among the

obese group (BF% >30). There was a significant association between the lack of physical activity

(

p

=0.002)

, educational level

(

p

=0.001)

and the risk of development of obesity. Concerning the age (

p

=0.06) and the gender (

p

>0.05) of the participants, there was no difference regarding these parameters and the risk of development of obesity (

p

>0.05).

A

strong

relationship

between

marriage and the development of obesity

was found,

when

83.90% of the obese group were married, whereas 73.70% of the non-obese group were single

(

p

<0.001)

.

Concerning

dietary assessment, our data revealed that the energy consumption of lipids slightly exceed

s

the recommended target

.

The

major consumed

foodstuffs

by the obese group were oils and fats

.

Conclusions

:

The adult participants of the region of Rabat have an unbalanced

body

weight status resulting from an altered dietary behavior and from an altered socioeconomic profile

that

can lead to various health complications.

Further studies are required o

n a large population

aiming to

develop effective strategies to

fight the rapid increase of

obesity

.

</w:p>

Keywords

:

Obesity, body mass index, dietary behavior, socioeconomic status.

</w:tr>

</w:tbl>

INTRODUCTION

Over the last years, the worldwide population has known a new leap concerning its eating habits, frequently assigned as “nutrition transition”.

This transition

is characterized by a higher caloric diet, a less consumption of complex carbohydrates

,

and a reduced intake of fibers, fruits and

vegetables [

1

].

.

Several

studies (clinical, epidemiological

, etc.

)

have highlighted the role of nutritional factors (integrating food) in the determinism of the main chronic diseases which ha

d

a significant human, social and economic cost among a society.

O

besity is one of these diseases in which nutritional factors

are involved [

2

].

Furthermore,

the lack of physical activity lead

ing

to

a decrease

of

energy expenditure, when combined with high caloric intake,

can

promote

the

development of obesity and a state of chronic inflammation [

3

]. The concern of

obesity

ha

s become a public health

issue

affecting

quality of life. It is well known that obesity is a major risk factor for

numerous

diseases and a variety of metabolic and medical complications

[

4

,

5

],

such as

;

cardiovascular disorders, type 2 diabetes

,

and some cancers, which in turn contribute to the mortality and morbidity

[

6

,

7

].

According to the

W

orld

H

ealth

O

rganization (WHO), since 1980, the worldwide prevalence of obesity has more than doubled (more than 70% of the adult population was obese

or overweight), with significant increases in every region [

8

].

39% of adults aged 18 years and over were overweight in 2016 and 13% were obese

[

9

].

.

In Morocco

,

the obesity phenomenon has also propagated;

referring to

the results of the national survey on anthropometry

,

carried out by the High Commission

for

Plan
ning
in 2011
,
t
he incidence of obesity
is affecting
3.6 million
Moroccan
adults, representing 17.9% of the population (21.2% in urban areas, 12.6% in rural areas). This is the case of 26.8% of women against 8.2% of men
[
10
].
Another recent study (2016) conducted on 10
524 Moroccan adult participants has revealed that 23.2% was the prevalence of obesity in that population [
11
].
Considering the rapid rise
of
overweight and obesity among the population, an increasing number of studies have highlighted the role of dietary components in the development of obesity
[
12
]; also excessive consumption of fat is well known to be considered
in this etiology [
13
,
14
].
Besides sedentary behavior, socioeconomic factors
play a role in the development of obesity
too
, especially in women which affect their eating behavior and then their body status
[
15
,
16
].
Giving the background information mentioned above
we aim, in the current study,
to examine the
relationship
between
dietary patterns, socioeconomic status
,
and the body mass index (BMI) in Moroccan obese and non-obese adults. To date,
the
non-such association has been fully investigated
.

SUBJECTS AND METHODS

Study Design

Type and period of study

This is an analytical case-control study, carried out over a period of one year, between 2015 and 2016.
The survey
was designed to examine the association of dietary patterns, socioeconomic status and the
BMI
in Moroccan obese and non-obese adults.

Place of study

The study took place at the
level of
Nutrition Unit, Hygiene and Collectivity Medicine Ward of the Military Hospital of Instruction Mohammed 5
th
(M.H.I.M.5, Rabat-Morocco).

Subjects

Inclusion criteria:

Participants

(male and female, adults: age between 18 and 59 years old) were recruited from the group of patients visiting the Nutrition Unit for a general health check-up, during the consultation days, or women represented 60% of the participants. A total of 250 consenting participants
,
recruited for the present study
,
were divided into two groups according to their
BMI
: obese ($BMI \geq 30$ kg/m²
) and non-obese (18.5 kg/m

2
 $\leq \text{BMI} \leq 24.9 \text{ kg/m}^2$
 2
) in accordance with the WHO reference values
 [
 1
 7
].
 Non-inclusion
 criteria:
 The
 non-inclusion
 criteria were chronic illnesses such as diabetes, hypertension, cardiovascular diseases
 , etc.
 , smoking, pregnancy and breastfeeding §/or menopause situation
 aiming
 not to bi
 as the results,
 since
 the
 relationship between obesity and these factors
 is well established
 [
 1
 8
 -
 19
].
 W
 ritten and oral consent
 s
 from all the participants were obtained for their involvement in the present study where they were assured about confidentiality and
 well i
 nformed
 on the
 procedure
 .
 Data collection
 C
 ollection
 of data
 was conducted by filling out a set of questionnaires including identity information, anthropometry, physical activity, socioeconomic
 status
 ,
 and data regarding dietary habits by using 24h dietary recall/food frequency assessment.
 Anthropometric measurements
 During the consultation days, while dressed in light clothing and without shoes, the body weight and height
 ,
 for the participants with eligible criteria
 ,
 were measured using a scale-stadiometer (Seca gmbh
 &
 Co.
 kg
 .
 Hamburg, Germany). The BMI was defined as the body weight (kg) divided by the height square
 d
 (m
 2
).
 W
 aist circumference (WC) was measured midway between the lowest ribs and the iliac crest in a horizontal plane, as to the hip
 circumference (HC); it was measured at the widest point
 over the buttocks.
 W
 aist-to-hip ratio (WHR) was calculated as waist measurement divided by
 the
 hip measurement.
 Furthermore,
 we assessed the body composition
 especially
 the body fat and the physical activity level, using bio-impedance technology (BodyStat Quadscan 4000).
 D
 ietary intake
 assessment
 24-hour food recall
 Aiming
 to collect information about their eating habits, participants were invited to provide three random 24-hour food recalls on three
 different days of the week. This is the most commonly used method for
 assessing
 dietary intake
 [

2
0
]. That
consists to estimate food consumption in the most precise way possible
[2
1
].
At the interview
meeting,
participant
s
were
not
previously informed about
the days of
questioning
,
aiming not to affect their
eating habits
.
They
were
asked to recall and describe qualitatively and quantitatively all food and beverages consumed during the 24 hours preceding the
interview
.
To help participants afford the most accurate data possible, we opted for a method with three main steps; first
,
the participant
s were
invited to list all food and beverages consumed in the last 24 hours. Second,
they
gave details about each consumption situation, regarding the items reported before (type, quantity, timing,
and
occasion). Third,
they were
asked to memorize any other food or detail that might have been forgotten
[2
2
].
Participants were assisted
to approximate portion size and
to be more accurate. S
tandard measurements
utilized were
:
- A photo notebook (SU.VI.MAX.) that constitutes a precious aid to improve the accuracy of the estimation of dietary intakes
[2
3
].
- A Food book: to estimate food consumption, contain
s
pictures of food models usually consumed in Morocco;
[
Aliments et Préparations Typiques de la Population Marocaine; by Khadija Elmoumni; Haute Ecole Lucia de Brouckère- CIRIHA-
Département de Diététique et Nutrition Appliquée; 2008; Brussels, Belgium
]
.
The weight equivalence (in grams) of
consumed
food was obtained
throughout
food quantification table, available in the corresponding manual, then the values were entered on the Nutrilog nutrition software (SAS,
version 3.11), to be
converted
into energetic nutrients (Proteins, lipids,
and
carbohydrates) and other elements on the survey period. All details about the average contribution of these nutrients in the total energy
intake (TEI) for the given period (3 days) were calculated and values are expressed in percentages and grams.
Food consumption frequency
To determine
participants'
eating habits over an extended period of time, a food frequency questionnaire (FFQ) was used as part of the present study.
The questionnaire estimated
the consumption
frequency
of certain foods
during
the last month preceding the

interview

. Participants completed the questionnaire after the 24-hour recall. They had to mention

how many times (never, number of times per month, week or day) have consumed the foods presented on the list

[

2

4

].

Socioeconomic status

The d

ata on socioeconomic profile and living environment

were

collected using an

appropriate

questionnaire including information about level of education, marital status, family size and the estimated food budget coefficient (defined as the budget estimate devoted to food consumption, from the total monthly budget: less than half of the monthly budget, between 50% and 70% and more than 70% of the total budget).

Statistical analysis

The data entry was

performed

using Epi-Info software (version 3.5.4)

.

T

he statistical analys

is

was

conducted

using

SPSS

software (Statistical Package for the Social Sciences) version 24. We tested the normality of each variable by one-sample Kolmogorov-Smirnov (K-S) test. The quantitative variables normally distributed were presented as means± standard deviation (SD); those none normally distributed were expressed on median [percentile

25, percentile

75]. The qualitative variables were expressed

i

n percentages. The qualitative variables were compared by the Chi-square test. The degree of statistical significance was considered for

p

<0.05.

RESULTS

Subject characteristics

Table

1

summarizes

the anthropometric characteristics of all the participants. The study included women with a percentage of 60% (n=150) and men (n=100). The participants

were divided into two groups

,

based on their

BMI

: obese (n=100) with a median BMI of 34.67 kg/m

2

and non-obese (n=150) with a median BMI of 22.25 kg/m

2

(

p

=0.01). Both groups had the same age (

p

=0.06) with a median of 32 years. The mean age of

the

obese group was 36±9.25 years and that of

the

non-obese group was 30.35±9.49 years. For the waist-to-hip ratio (WHR), no

significant

difference was observed between obese and non-obese group (

p

=0.9). For body fat percent (BF %), a significant difference was observed between the two groups (

p

=0.02), the median value and percentiles were

respectively 44.30 [40.50, 47.40] and 27.50 [21.20, 29.70] for obese and non-obese individuals

.

Concerning

physical activity, a significant association with the risk of obesity was observed (

p

=0.002), where 70.40% of obese subjects exhibit a very low rhythm and only 7.40 % with medium cadence. No difference was observed between genders (p>0.05)

as shown in

Table

1.

The socioeconomic status of the participants is reported in

T
able 2.
A
significant relationship between the major variables and the
BMI
of the participants
was found
. In fact, a significant
correlation was observed
between educational level and the BMI
among
the studied
group
(
p
=0.001).
Further
significant association was found
regarding
marital status,
when
83.90% of the obese group were married, whereas 73.70% of the non-obese group were single (
p
=0.000). Finally, no difference
was noticed concerning
household size (
p
=0.2), coefficient food budget (
p
=0.232) and the risk of obesity. No difference was observed between genders
(
Table
2
)
.

DISCUSSION

The study was designed to investigate the relationship between socioeconomic status, eating behavior, and the development of obesity in obese (case) and non-obese (control) Moroccan subjects.

Our results showed that there was a highly significant difference between the two groups

, regarding their anthropometric measurements ($p < 0.01$). In the current study, the prevalence of abdominal obesity was considerable

as the prevalence of overall obesity for the obese group who exhibited class II of obesity ($\text{BMI} \geq 35 \text{ kg/m}^2$

, $\text{BF \%} > 30$)

[17 , 2

5]

The WHR

defined an abdominal obesity ($\geq 0.90 \text{ cm}$ for men and $\geq 0.85 \text{ cm}$ for women; WHO guidelines), in which the risk of metabolic complications, as well as serious health issues

, is substantially increased

, because of the fat distribution [2

6]

This last indicator has also been shown to be a greater predictor of cardiovascular disease

s [2

7]

A high

ly significant association was

found between the lack of physical activity and the risk of developing obesity. Where 70.40% of obese subjects had a very low level, whereas 7.40 % had a medium level. This, it is compatible with the finding of a previous survey indicating that only 0.8% of Moroccan

s are practicing sport

[2 8

]. Results from another study

showed

a linear association of physical activity and other health status like obesity, cardiovascular disease, diabetes [

29]

.

Indeed, several studies reported that

, the lack of physical activity does not only lead to overall/abdominal obesity

, but also is associated with increased indicators of systemic inflammation

[3 0 , 3 1].

Socioeconomic status is considered to be associated with overweight and obesity risk, that is generally measured by the educational level, income, marital status, etc. Results from the 1996 Health Survey for England revealed the association of a higher risk of obesity and the lower educational/economic level and a lower occupational status

[3 2].

In our study, the educational level plays a significant role in the development of obesity ($p=0.001$) among Moroccan subjects, when 19.60% of the obese group were illiterate, whereas 72.50% of the non-obese group had a university degree. These results agree with those from a national survey that revealed the predominance of obesity among adults with low levels of education

[2 8] and disagree with a Polish study conducted in southwestern region, in which the educational level did not have a significant role

[3 3].

Another significant association was found concerning marital status, when 83.90% of the obese group were married, whereas 73.70% of the non-obese group were single ($p=0.000$). Finding from other studies have highlighted the strong association of marriage and the development of obesity

[3 4 , 3 5].

. Indeed, there was no difference regarding household size, coefficient food budget and the development of obesity ($p>0.05$). Also, no difference was observed between genders. In the present study, we assessed the eating habits of our participants, through the 24h dietary recall and a food frequency questionnaire. We calculated the frequency of consumption of all food patterns generally consumed by Moroccan population. Our results showed that the carbohydrates and lipids were the main macronutrients consumed and represent respectively, 48.98% and 33.80% of total energy intake in the obese group and 48.20% and 33.00 % of

TEI
in the non-obese group. Compared to the nutritional guidelines (FAO/WHO), it seems clear that the energy needs of carbohydrates for both groups are not sufficiently covered, while their energy needs of lipids slightly exceed the recommended target [3, 6].
Results from two other studies indicate that the fat intakes of a population exceed by 10% the recommendations, and most of individuals do not consume sufficient vegetables/fruits or fibers [3, 7].
Moreover, the finding from the frequency questionnaire showed that the major consumed foodstuffs, by the obese group, were oils and fats, contrary to the non-obese group, where the cereals and legumes were the main consumed. These results show the difference observed in the quality of food usually ingested. In general, when comparing the nutritional intake of both groups, we did not observe any significant difference, even between genders ($p>0.05$). Our survey provides baseline data on the dietary intake of the target population. It seems prudent to increase the implementation of effective strategies to combat obesity, taking into consideration the requirements of a better understanding of the associated risk factors through the study of physiological and genetic mechanisms in a large population.

CONCLUSION
To the best of our knowledge, the current study constitutes the first case-control study identifying the relationship between socioeconomic status, dietary behaviors and the high levels of BMI among a group of Moroccan adults that showed an unbalanced weight status resulting from an altered dietary behavior and an altered socioeconomic profile. We do believe that our results will

lead
to
a better
understanding of the implication of some factors in the development of obesity in Moroccan population.
Further research is required
on the effect of
obesity on health taking into consideration the socioeconomic impact
