 masoor
 </w:r>
 and
 mung dal
 soups in women. Soy-milk (350 mL) contained 36.25 µg daidzein and 43.81 µg genistein.
 Masoor
 and
 mung dal
 soups (350 mL) contained daidzein (37.66 and 27.66 µg) and genistein (37.33 and 44.00 µg).
 </w:p>
 A food-chart was
 provided
 to
 all participants who
 were
 informed
 to avoid food containing isoflavones (such as
 mung dal
 ,
 masoor dal
 , soybean, raw garlic, gr
 een beans, potatoes, sweet potatoes, chickpeas, wheat flour, grapefruits, dates, eggs, and nuts) at least for one week before and during
 the study.
 Preparation of soy-milk,
 mung
 and
 masoor dal
 soups
 The whole
 soybean
 amount (100- g) was immersed in drinking-water in a pot for 4-5 hours. The soft beans (water soaked) were washed with water,
 blended into mould using a kitchen blender. Water (500- mL) was added to the mould, boiled for three minutes, and stirred with a
 wooden kitchen stirrer. The milk was collected by squeezing through a pre-cleaned cloth filter and was boiled with medium
 temperature again for 20 minutes and stirred to reduce its volume
 up
 to ~350 mL.
 Both
 mung
 and masoor
 dal
 amounts
 (100 g)
 were
 washed with clean water
 ,
 and 500 mL of water
 with
 a small amount of salt (NaCl) and turmeric powder were added to it
 then
 boiled with medium temperature for 25 minutes, and stirred with a wooden kitchen stirrer to reduce the volume up
 to ~350 mL.
 Standard of Isoflavones
 For measuring the
 determinants
 of isoflavones in human serum, authentic standards of daidzein and genistein, purchased from Sigma-Aldrich, were preserved at 4
 °
 C and at -20 °C respectively.
 Isoflavones extraction from human serum
 In
 overall
 , 384 (8x16x3) serum samples were collected from 16 postmenopausal women
 during
 the three test periods
 ,
 after serving soy-milk and soups
 ,

prepared from
masoor
and
mung dal

. The blood samples were centrifuged at 1200 rpm, and the serum (~2 mL) was separated and immediately frozen at -20 °C until analysis

,
to avoid
any
target compounds
biodegradation.

Isoflavones were extracted from the defrosted serum, and the sample was cleaned up using solid-phase extraction (SPE C18 Cartridge). The cartridge was conditioned with water (1 mL x 3) followed methanol (1 mL x 3) and then water again. The serum sample was thawed and then passed through the conditioned SPE cartridge, then aqueous 5% methanol (800 µL) was added. The isoflavones were eluted in ethyl acetate-acetonitrile mixture (1:1; 400 µL x 2). Sixty-four serum samples of 16 women from each test foods were cleaned. Thus, the total number of cleaned serum samples was 192 (64 x 3) from 384 serum samples. The cleaned serum samples were filtered through the LC samples filter having a pore size of 0.22 µm [PTFE (polytetrafluoro ethylene)]-syringe filter cartridge and transferred to a sample vial (2-mL) and analysis was done using LC-PDA.

For the chromatographic analyses, a Shimadzu SCL 10A vp LC system (Shimadzu, Kyoto, Japan) equipped with a PDA detector (SPD-10A vp), a Supelco discovery reversed phase C18 column (25 cm×4.6 mm i.d. particle size: 5 µm) and a Rheodyne injector (loop size 20

µL) was used. Standards and cleaned extracts (100 µL) were injected through a Rheodyne injector. Separations were carried out at 268 nm

,
using an isocratic mobile phase of acetonitrile and water (ACN: H₂O) (75: 25), with a flow rate of 0.5 mL/min, and the running time was 10 minutes. The LC system was conditioned by passing mobile phase until the smooth baseline was obtained.

Determination of daidzein and genistein in human serum samples

The standard solutions of daidzein and genistein at the concentrations of 5, 10, 15, 20, and 25

µg/mL were injected into LC-PDA. Two calibration curves were established

from above five solutions of the daidzein and genistein by plotting peak area vs concentration (µg/g).

The certified standards of daidzein and genistein (10

µg/mL) were injected separately

.
The retention time of both certified standard isoflavones were found to be 5.52 and 6.03 minutes respectively

,
before serum extracts analysis using LC-PDA. The serum samples were injected into the LC system with one injection of standard after each two or three injections of the samples

,
to control whether there was a deviation in the retention times of standards or not. By comparing the retention times of standard peaks with that of the sample peaks; the possible daidzein and genistein peaks in chromatograms of the samples were determined. The amount of daidzein and genistein

,
in human serum samples

,
were calculated from the external calibration curve of certified standard of daidzein and genistein

,
taking into consideration that the peak area is in the midpoint of the curve (considering linearity of the curve). A number of unknown analytes in the respective samples were identified using formula

(1)

:

Amount of unknown sample =

... (1)

Peak Area sample = Peak Area of the sample

Conc. Std = Concentration of the standard

Peak Area std = Peak Area of the standard

Conc. matrix = Concentration of the matrix

The daidzein and genistein serum concentration-time profiles

,
for each individual

,
and the mean concentrations at each dose

,
were determined employing a non-parametric estimation of AUC (area under the curve) and C_{max}

(maximum concentration). Trapezoidal formula was used for calculating AUC.

Statistical Analysis

S

tatistical analysis was performed using SPSS (Statistical package for social Science) software for Windows version 22 (SPSS Inc, Chicago, Illinois, USA). For analysis, log- transformation of the data was done

.
The data was expressed as geometric mean ±SD (Standard deviation). The statistical significance of differences between the values was analyzed by ANOVA (Analysis of variance). A

P

value of <0.05 was considered statistically significant.

Results

The present study
concerned

the determination of two isoflavones daidzein and genistein in the serum of 16 middle socioeconomic class postmenopausal women, whose mean age was 52.5 ± 5.8 years. Other clinical parameters

selected

were

:

pulse (mean $\pm$ SD, beats/min, 68.2 ± 6.4), systolic blood pressure (SBP) [mean $\pm$ SD, mmHg, 116.5 ± 6.7], diastolic blood pressure (DBP)

[mean $\pm$ SD, mmHg, 76.5 ± 5.1] and body mass index (BMI) [mean $\pm$ SD, kg/m² 25.7 ± 5.3] (Table 1).

Table 1:

Demographic and clinical characteristics of postmenopausal women (n=16)

Variables

Age (y

ears

)

52.5 ± 5.8

Pulse (beats/min)

68.2 ± 6.4

SBP (mmHg)

116.5 ± 6.7

DBP (mmHg)

76.5 ± 5.1

BMI (kg/m²)

25.7 ± 5.3

Results are expressed as mean $\pm$ SD; BMI=Body mass index;

SBP=Systolic blood pressure;

DBP=Diastolic blood pressure

An excellent symmetrical elution pattern was obtained in the chromatograms during 4-8 hours of duration (Figures

3-5). The chromatograms showed efficient separation and correct integration of genistein in the blood samples. After four hours, degradation might have occurred because several small peaks were found earlier than the retention time of genistein.

A

t an interval of 2, 8, 24, 36, and 48 hours, no elution pattern of genistein was observed. The determinant of genistein were responded in 8, 15, and 5 postmenopausal women following a single dose of orally-administered soy-milk,

masoor

and

mung dal

soups during 4-6 hours respectively (Figure

ure

6). The determinations of the serum isoflavones genistein was found 2.6% in soy-milk, 3.8% in

masoor dal

soup and 3.7% in

mung dal

soup

,

respectively.

No peak was

observed

at the retention time of daidzein which indicates its non

-

availability in the blood samples.

From the area in the chromatogram, the maximum concentration amount of each sample was calculated. The results are expressed as

C

max

, AUC and T

max

(at time of the maximum concentration)

[

16,17,20-22

]

.

Table 2 presents the geometric mean AUC and C

max

of serum isoflavones genistein of soy-milk,

masoor

and

mung dal

soups. In soy-milk, the geometric mean AUC and the geometric mean C

max

of serum genistein was 0.82 ± 0.22 μ g/mL and 0.17 ± 0.19 μ g/mL. The geometric mean AUC and the geometric mean C

max

of serum isoflavones genistein in the

masoor

and

mung dal

soup was 1.01 ± 0.32 μg , 0.45 ± 0.32 μg , 1.12 ± 0.31 μg , 0.63 ± 0.31 μg per mL

, respectively. The basis of the calculation of AUC (Trapezoidal formula) is the supposition that there exists a AUC during 4-6 hour. The pharmacokinetics data (AUC and C

max

) were compared according to food items, using ANOVA. No significant differences

,

in serum genistein

AUC,

were observed within the three food items (soy-milk vs

Discussion

The determination of serum daidzein and genistein were assessed in Bangladeshi postmenopausal women

,
after a single dose of orally administered soy-milk, soups of

masoor

and

mung dals

respectively. Results of two studies showed that that the AUC of soy genistein was greater than that of daidzein

[

21,23

]

. In the present study, the

mean AUC and the C

max

of serum isoflavone genistein of soy-milk were 0.82 µg/mL and 0.17 µg/mL

,

respectively.

Cassidy

et al

. reported that the AUC of genistein was 54.06 µmol/L after the ingestion of soy-milk in postmenopausal women

[20]
 whereas the AUC of soy-milk genistein was less in the study subjects. The C_{max} of soy-milk genistein , among our participants, was higher than that was found in the study of Cassidy et al .

[20]
 . The availability of genistein in serum was 2.6% after the ingestion of orally administrated single dose soy-milk and the amount was less compared to the study of Okabe et al .

[16]
 Variations in results might be due to the physiological differences (intestinal condition) between races, due to the ingestion form of isoflavones, and for the location of cultivation too . Other factors, such as differences in the food matrix (liquid vs solid), composition of habitual diets (fiber, fat, protein), low content of isoflavones in foods, and study design might also play a role in the determination of serum daidzein and genistein among the postmenopausal women

[24]
 . Generally, 1-6 hours are needed to obtain maximum plasma concentrations for free genistein and 4-6 hours for total genistein (aglycone + conjugates)

[25]
 . In the current study, the average time to obtain maximum concentration (T_{max}) of soy-milk was 4-6 hour. Another study showed that liquid matrix yields a faster absorption rate, higher peak serum concentration, and maximum time concentration than a solid matrix

[20]
 . Blood sampling frequency and timing were fixed in the present study following the studies among Thai

[17]
 , the UK

[21]
 , and the USA

[22]
 menopausal women. No literature was found on the bioavailability or the determination of isoflavones in South-East Asian postmenopausal women. The absorption patterns of isoflavones among USA, UK , and other Asian menopausal women were not similar to those we found .

To the best of our knowledge , there is no study on the determination of isoflavones in non-soy food, such as masoor and

mung dal
 . In the present study, the AUC and C
 max
 of genistein was 1.01 µg/mL and 0.45 µg/mL respectively in the
 masoor dal
 soup and, the AUC and C
 max
 of genistein was 1.12 µg/mL and 0.63 µg/mL respectively
 I
 n
 mung dal
 soup
 that
 were similar to the bioavailability of
 isoflavones in soy-foods done by other investigators
 [
 16,20,21,23,26
]
 .
 After consum
 ing
 soy-milk, the mean AUC of serum genistein was 0.82 µg/mL, which
 was
 lower compared to
 masoor
 (1.01 µg/mL) and
 mung dal
 soups (1.12 µg/mL), however, the differences were not significant. The mean serum genistein concentrations (C
 max
) of
 masoor
 (0.45 µg/mL) and
 mung
 (0.63 µg/mL)
 dal
 soups were higher
 too
 compared to that of soy-milk (0.17 µg/mL) and there
 was
 a significant (P
 =0.03) difference between soy-milk and
 mung dal
 soup. This finding is
 valuable
 and promising for general
 population
 , especially for menopausal women
 living in
 developing country
 such as
 Bangladesh
 , i
 n
 which,
 soybean or such food
 are
 not widely known to the general
 population
 but pulses (dal
) called the poor men's protein,
 constitutes
 the most common foodstuff consumed by Bangladesh
 i
 population
 almost every day. Consequently, the determinant of isoflavones genistein of
 masoor
 (3.8%) and
 mung dal
 (3.7%) soups (Fig
 ure
 6) was also found high in postmenopausal women.
 It was not possible to
 compare the determination of isoflavones of non-soy foods in serum to other countries due to the lack of data. However, in the current
 study, determinant of isoflavones genistein of non-soy food was found more than soy milk.
 The preset study had a couple of limitations. The sample size
 was
 small. Daidzein from the
 masoor
 and
 mung dal

soups and soy-milk did not show any peak at their retention time, which suggests the non-availability of daidzein in blood samples, although genistein from the above three foods gave some peaks at the allocated time but not full profile. It might happen due to following the literature-based fixed frequency and timing of blood collection, which was not appropriate for the present study. Therefore, it was not possible to get the full profile and as such the serum concentration curve could be produced. Another limitation was the failure to collect urine samples from the study subjects because of their unwillingness and lack of fund and time. It may be assumed that different ethnicity, selection of appropriate time for blood collection, after the ingestion of food, quantity of individual and total isoflavones in foods, played an important role in the determination of isoflavones in the Bangladeshi postmenopausal women.

Conclusion

In conclusion, the findings of this pilot study suggest that the determination of isoflavones in non-soy foods (mung and masoor dals) is comparatively better than soy foods in Bangladeshi postmenopausal women, and only isoflavones genistein show considerable availability in women. It seems to be beneficial for menopausal women in our country as an alternative of prescribing HRT.

Based on

our findings, it is strongly recommended that before the ingestion of isoflavones-rich foods, the form of isoflavones (aglycones vs glycosides) must be known, food matrix shall be considered, and a careful study design is necessary to know the complete pharmacokinetic characteristics of daidzein and genistein in Bangladeshi postmenopausal women.

Ethical approval

All procedures performed in our protocol study, involving human participants

, were in accordance with the ethical standards of the Ethical Review Committee of the Diabetic Association of Bangladesh (BADAS) and with the 1964 Helsinki declaration and its later amendments or comparable ethical standards. Written consent was obtained from each postmenopausal participant

woman after the full explanation of the nature of test, purpose, and potential risks of all the procedures to be used in the study. Their personal information was kept confidential.

Acknowledgement

The authors acknowledge with gratitude the contributions of respected teachers
